

HOW SHOWERMISER WORKS

SHOWERMISER simply connects to your shower outlet. By flipping the diverter lever, you recirculate cold water back into the fresh water tank, before it comes out of the showerhead. Once the pipe is clear of cold water, our patented, color-changing temperature indicator will show you in under four seconds that hot water has arrived. Just flip the diverter lever back to the showerhead and hot water will flow.

HOW IT WORKS
